**Winter Semester 2022-2023**

**School of Information Technology and Engineering**

**Course Title:** Web Technology Theory

**Course Code:** BITE304L

**Slot:** D2+TD2

**Faculty Name:** Dr. Vijayan R

**Team:**

1. Rahul L [21BIT0343]
2. Naveen Balaji C R [21BIT0554]
3. Barath M [21BIT0310]

**DA-1**

**Front-end web development**

**Online Food Ordering System**

**Description:**

An online food ordering system is a digital platform that allows customers to order food online from a restaurant. It typically consists of a website or mobile app where customers can browse the restaurant's menu, select their desired items, customize their orders (e.g. specifying ingredients or dietary restrictions), and pay for their order securely online. The online food ordering system then sends the order to the restaurant's kitchen or point-of-sale system for preparation and fulfillment.

From a restaurant's perspective, an online food ordering system can provide numerous benefits, such as increased order accuracy, improved efficiency, and the ability to collect customer data for marketing purposes. From a customer's perspective, an online food ordering system offers convenience and flexibility, as they can place orders from anywhere with an internet connection and avoid the hassle of phone orders or waiting in line.

The growing trend of digitalization has made online food ordering systems more popular than ever before. With the ability to order food from anywhere with an internet connection, customers can enjoy their favorite meals without leaving their homes. Moreover, restaurants can expand their customer base by offering online ordering, as customers can easily find and order from their favorite restaurants using their smartphones or computers.

In summary, an online food ordering system is a powerful tool for restaurants and customers alike. By simplifying the ordering process and enhancing the customer experience, this system is transforming the food industry and changing the way we order and enjoy our favorite meals.

## **Modules:**

Our project consists of 5 modules:

- HomePage
- Login
- Create account
- Menu
- AboutUs

### HomePage:

This page has details about the restaurant and users will see this page as first. They can navigate to other pages from here. In this page the user can publish the reviews and it will be displayed as recent comments

This page is created with HTML, CSS and JQuery.

### Login:

This page allows the user to enter the username and password and gets them into the menu page on submitting.

This page is created by using HTML, CSS and the login form is validated by using Javascript.

### Create account:

This page enables the user to create an account by entering the details mentioned in the form and after submitting they can enter into the menu page for ordering food.

This page is created by using HTML, CSS and the login form is validated by using AngularJS.

### Menu:

This page displays the variety of dishes available in the restaurant with separate categories like veg, non-veg, juices, sweets etc..They can add the items to the cart and also they can add the items to their favorite list.

The cart will display the details of the added items with respective prices and the quantity. It also displays the total price amount. The user has an option to edit the cart items or clear the cart.

This page is created using HTML, CSS, Javascript, AJAX and JSON. For the menu items of the restaurant we used the JSON file to store the different dishes names along with prices. We used JS to fetch the details from the JSON file and display it according to the sub-categories like veg, non-veg etc.

We also used Bootstrap to display the menu in a neat order.

### AboutUs:

This page contains the simple details of our restaurant. This page is created by using HTML and CSS.

**Course Title:** Web Technology Theory

**Course Code:** BITE304L

**Slot:** D2+TD2

**Faculty Name:** Dr. Vijayan R

**Team:**

1. Rahul L [21BIT0343]
2. Naveen Balaji C R [21BIT0554]
3. Barath M [21BIT0310]

**DA-2**

**Back-end web development**

**Online Food Ordering System**

**Description:**

An online food ordering system is a digital platform that allows customers to order food online from a restaurant. It typically consists of a website or mobile app where customers can browse the restaurant's menu, select their desired items, customize their orders (e.g. specifying ingredients or dietary restrictions), and pay for their order securely online. The online food ordering system then sends the order to the restaurant's kitchen or point-of-sale system for preparation and fulfillment.

From a restaurant's perspective, an online food ordering system can provide numerous benefits, such as increased order accuracy, improved efficiency, and the ability to collect customer data for marketing purposes. From a customer's perspective, an online food ordering system offers convenience and flexibility, as they can place orders from anywhere with an internet connection and avoid the hassle of phone orders or waiting in line.

The growing trend of digitalization has made online food ordering systems more popular than ever before. With the ability to order food from anywhere with an internet connection, customers can enjoy their favorite meals without leaving their homes. Moreover, restaurants can expand their customer base by offering online ordering, as customers can easily find and order from their favorite restaurants using their smartphones or computers.

In summary, an online food ordering system is a powerful tool for restaurants and customers alike. By simplifying the ordering process and enhancing the customer experience, this system is transforming the food industry and changing the way we order and enjoy our favorite meals.

## **Modules:**

Our project consists of 5 modules:

- HomePage
- Login
- Create account
- Menu
- AboutUs

### HomePage:

This page has details about the restaurant and users will see this page as first. They can navigate to other pages from here. In this page the user can publish the reviews and it will be displayed as recent comments

This page is created with HTML, CSS and JQuery.

### Login:

This page allows the user to enter the username and password and gets them into the menu page on submitting.

This page is created by using HTML, CSS and the login form is validated by using Javascript.

### Create account:

This page enables the user to create an account by entering the details mentioned in the form and after submitting they can enter into the menu page for ordering food.

This page is created by using HTML, CSS and the login form is validated by using AngularJS.

### Menu:

This page displays the variety of dishes available in the restaurant with separate categories like veg, non-veg, juices, sweets etc..They can add the items to the cart and also they can add the items to their favorite list.

The cart will display the details of the added items with respective prices and the quantity. It also displays the total price amount. The user has an option to edit the cart items or clear the cart.

This page is created using HTML, CSS, Javascript, AJAX and JSON. For the menu items of the restaurant we used the JSON file to store the different dishes names along with prices. We used JS to fetch the details from the JSON file and display it according to the sub-categories like veg, non-veg etc.

We also used Bootstrap to display the menu in a neat order.

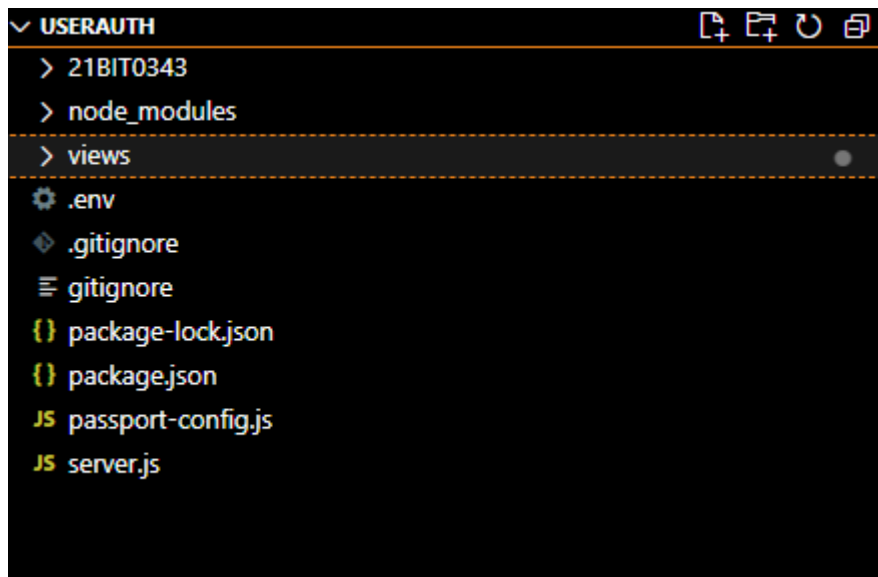

### AboutUs:

This page contains the simple details of our restaurant. This page is created by using HTML and CSS.

### **Backend(server-side):**

The server-side of our project helps the user to register a new account and then log into our website. Then the user can login to the website using the registered credentials. This page is basically an user authentication server-side system. We created the backend part using NodeJS and ExpressJS. Npm modules are used widely in our code.

## Codes:

### [server.js]

```
if (process.env.NODE_ENV !== "production") {  
  require("dotenv").config();  
}
```

```
//importing libraries that we installed using npm  
const express = require("express");  
const app = express();  
const bcrypt = require("bcrypt"); // importing bcrypt package  
const passport = require("passport");  
const initializePassport = require("./passport-config");  
const flash = require("express-flash");  
const session = require("express-session");  
const cookieParser = require("cookie-parser");  
const mongoose = require('mongoose') // importing cookie-parser  
middleware
```

```
initializePassport(  
  passport,
```

```

    email => users.find(user => user.email === email),
    id => users.find(user => user.id === id)
  );

  const users = [];

  app.use(express.urlencoded({ extended: false }));
  app.use(flash());
  app.use(
    session({
      secret: process.env.SECRET_KEY,
      resave: false, // We wont resave the session variable if nothing is
changed
      saveUninitialized: false,
    })
  );
  app.use(passport.initialize());
  app.use(passport.session());
  app.use(cookieParser()); // using cookie-parser middleware

  //for login page post functionality
  app.post(
    "/login",
    passport.authenticate("local", {
      successRedirect: "/index",
      failureRedirect: "/login",
      failureFlash: true,
    }),
    (req, res) => {
      // setting the cookie after successful authentication
      res.cookie("email", req.user.email, { maxAge: 900000, httpOnly: true
});
      console.log(req.cookies);
      res.redirect("/index");
    }
  );

```

```
);
```

```
//for creating account page post functionality
```

```
app.post("/register", async (req, res) => {  
  try {  
    const hashedPassword = await bcrypt.hash(req.body.password, 10);  
    users.push({  
      id: Date.now().toString(),  
      username: req.body.username,  
      firstname: req.body.firstname,  
      lastname: req.body.lastname,  
      email: req.body.email,  
      password: hashedPassword,  
    });  
    res.redirect("/login");  
    console.log(users); //display newly registered users in console  
  } catch (e) {  
    console.log(e);  
    res.redirect("/register");  
  }  
});
```

```
//routing
```

```
app.get("/index", (req, res) => {  
  // reading the cookie value and passing it to the template  
  const email = req.cookies.email;  
  res.render("index.ejs", { email });  
});
```

```
app.get("/login", (req, res) => {
